

Sales Performance Analysis Report

Three-Year Revenue Review (2003–2005)

Prepared by Omogoroye Israel Olumide — Data Analyst

Executive Summary

This report analyses three years of sales performance for a scale-model collectibles distributor operating across 19 countries and 7 product lines — including classic cars, motorcycles, planes, ships, and trains. The business generated \$9.02M in total revenue between 2003 and 2005.

Performance peaked in 2004 at \$4.5M before declining sharply to \$1.3M in 2005. While this looks like a business collapse at first glance, the underlying data tells a more precise story: the 2005 figures only cover the first two quarters of the year, not a full annual cycle. Comparing 2005 directly against the two complete prior years overstates the apparent decline.

A consistent seasonal pattern emerges across both complete years: revenue peaks sharply every November, consistent with pre-holiday-season buying behaviour for a collectibles business. This is a predictable, recurring opportunity — not a one-off spike — and should inform future inventory and marketing planning.

Key Metrics

Metric	Value
Total Revenue (2003–2005)	\$9.02M
Countries Served	19
Product Lines	7
Peak Year	2004 — \$4.5M
Lowest Year	2005 — \$1.3M (partial year, Q1–Q2 only)
Peak-to-Low Gap	\$3.2M
Top Revenue Region	EMEA — \$4.6M
Top Revenue Country	USA — \$3.1M
Top Product Line	Classic Cars — \$3.6M

Dashboard Overview

The visual below shows the full Power BI dashboard built to support this analysis, including revenue breakdowns by region, country, product, and time period.

Key Findings

1. The 2005 decline is partly a reporting artifact, not a pure business collapse

2005 revenue of \$1.3M reflects only two quarters of recorded data, compared to full-year totals in 2003 and 2004. Evaluating 2005 performance requires a quarter-by-quarter comparison against equivalent periods in prior years, rather than a straight annual comparison. This distinction matters: it changes the question from "why did the business collapse" to "is the business on pace, given partial data."

2. November is a reliable, recurring revenue peak

Both complete years (2003 and 2004) show a sharp, consistent revenue spike in November, well above any other month. Given the product mix — collectible cars, planes, trains, and ships — this is consistent with pre-holiday gift-buying season rather than a one-off event. This is a predictable pattern the business can plan inventory, staffing, and marketing around in advance.

3. Revenue is heavily concentrated in a small number of markets and products

EMEA alone generates \$4.6M of the \$9.02M total — exceeding North America's \$3.3M combined with the rest of the world. At the country level, the USA alone generates \$3.1M, nearly three times the next-highest country, France, at \$1.1M. Similarly, Classic Cars account for \$3.6M of total revenue, well ahead of every other product line. This concentration is both a strength (clear leading markets and products) and a risk (limited diversification if conditions shift in any one segment).

Recommendations

- Treat 2005 as an incomplete-data year in any year-over-year reporting, and prioritise closing the data gap before drawing further conclusions about that year's performance.
- Build inventory and marketing plans around the confirmed November seasonal peak, rather than treating it as unpredictable.
- Investigate diversification opportunities outside EMEA/USA and outside the Classic Cars product line, to reduce reliance on a small number of markets and products.

Data Source & Methodology

Dataset sourced from Kaggle (publicly available scale-model distributor sales data). Analysis and visualisation built in Power BI Desktop, using slicers, DAX measures, and regional/product breakdowns. This report reflects patterns observed in the dataset as provided and has not been independently audited against external financial records.
